

Painters are chronically exposed to lead based paints products, which eausescause anemia by impairing heme biosynthesis and increasing the red blood cell destruction. The present study was conducted aimed to assess the lead exposure and haematological hematological effects of lead inamong brush painters as they are chronically exposed to lead based paints.

Objective: To estimate the prevalence of anemia among brush painters and assess lead exposure among them. brush painters.

Methodology: A cCommunity_based cross-sectional study was conducted on 100 occupational residential brush painters of Mysore city of India during, from July 2012 and to September 2012. The sSubjects were interviewed using standardized questionnaire, mainly for to obtain information on lead toxicity symptoms and personal hygiene. Venous blood samples were drawn and haematological parameters were determined (n==100). The marker of anaemia anemia was haemoglobin bemoglobin concentration. Through Systematic random sampling, 30 samples were selected for estimating blood lead concentration (PbB) estimation.

Results: The prevalence of anemia among the subjects was 3% among the subjects. The mean hemoglobin concentration was 15.5±±1.4 g/dL, and the mean blood lead concentration (PbB)—was 12.9±±10.9 µg/dL. There was no significant correlation found between the PbB and haematological parameters. There was a high prevalence of lead toxicity symptoms; and the symptoms were more frequent in the less hygienic subjects than in the hygienic subjectsones. Blood lead concentration PbB among these painters is was less than the threshold (PbB >50 µg/dL) for hematological hematological alterations (>50 µg/dL). Hence, lead—induced anaemia is not a health risk among brush painters. The PbB is was also—less than the recommended threshold for occupational exposure (30 µg/dL). But, but the high prevalence of lead toxicity symptoms indicates the long—term health effects of lead, even at

Comment [A1]: A compound modifier contains 2 or more words, which act together as one adjective and are connected by hyphens. Hyphens are used with these terms so that their meaning is understood clearly.

Comment [A2]: Repetition of information in the text adds to wordiness and hampers understanding. Here, some text has been deleted as it has already been provided in the previous sentence and is therefore not essential at this instance.

Formatted: Font: Not Bold

Comment [Editor3]: Abbreviations are usually spelt out once at their first mention in the text, and the abbreviated form is used consistently thereafter. As PbB has already been defined above as "blood lead concentration," only the abbreviation has been used at this instance.

Comment [Editor4]: In academic writing, the simple past tense is usually used to describe the findings of the study, while the present tense is used to state conclusions/already established facts.
